Thank you for your submission of the team group component of AS1.

What was done well:

The report presents a clear and focused business question that is relevant to Airbnb pricing and business decision-making. The purpose of the analysis is easy to understand.

The methodology is well structured and includes appropriate data preprocessing, feature engineering, regression modelling, and clustering techniques.

The comparison of Decision Tree, Random Forest, and Gradient Boosting models demonstrates a good understanding of machine learning applications.

The visualisations are relevant and support the discussion effectively.

Geographic analysis and feature importance provide useful business insights.

The recommendations are practical and linked to the findings, particularly the discussion around pricing uncertainty and different host segments.

What could be improved:

The report would benefit from more critical discussion of the modelling process and the limitations of the chosen algorithms. The evaluation focuses mainly on results rather than analysing why certain models performed better than others.

The clustering analysis is relatively brief. You could have provided deeper interpretation of the clusters and their strategic value to Airbnb.

The rationale for selecting specific features and enrichment datasets could have been discussed in more detail.

Some figures are referenced appropriately, but additional explanation of the visualisations would strengthen the analysis and help justify the conclusions.

The expected business impact could have been developed further with clearer discussion of potential benefits, risks, and implementation considerations.

General comments for future work:

This is a good report that demonstrates solid technical skills and a structured approach to solving a real-world business problem.

For future work, you should focus on providing deeper critical evaluation of your modelling decisions and a more detailed interpretation of results.

You could strengthen the business dimension by discussing how recommendations would be implemented and measured in practice.
Overall, the report shows good understanding of machine learning techniques, supported by relevant visualisations and business-focused recommendations, but further critical analysis would strengthen the work.
